

# Colitis Ulcerosa

## Dead Infection

Convulsive spasms make taking food impossible. Large intestine perforation

causes dease. Anatomised reveraibility of phlogistic and ulcerous

transitions increase. Unbearable agony refuses family condolences. Hospital

staff is helpless. A breathing body is undergone the final surgical

intervention. It's too late, anyway. An alien molecule floods e ntails and

burns his final breath. Bowels explosion. A compound of semi-digested food

flows from his mouth.
