

## Colitis Ulcerosa

### Dead Infection

Convulsive spasms make taking food impossible. Large intestine perforation

causes decease. Anatomised reveraibility of phlogistic and ulce  
rous

transitions increase. Unbearable agony refuses family condolenc  
es. Hospital

staff is helpless. A breathing body is undergone the final surg  
ical

intervention. It's too late, anyway. An alien molecule floods e  
ntails and

burns his final breath. Bowels explosion. A compound of semi-  
digested food

flows from his mouth.
