Nucleosynthesis

Order From Chaos

Shock wave - compression, condensation

Asymmetric magnetism - emergent protostar

Protostar contracion cause thermonuclear reaction

Chandrasekhar limit, HR, main sequence star

Main sequence for a billion years

Hydrogen depletion - contraction begins

Compression overcomes - expansion (to) commence

Turn off point - main sequence is left

Constrant luminosity hides hydrogen expansion A billion years pass until (the) helium flash Triple-Alpha-Process causes shrinkage in size (A) Planetary Nebula is discharged - and dies

Nucleosythesis - shock wave charges (the) surface Uncontainable - Supernova bursts forth Most (of) its mass is lost - Stellar Pentecost White Dwarf dies - Neutron star survives Or a Blackened Hole?
